MEDFLOW TRANSCRIBE AI

Customer Onboarding & Support Guide

A practical Q&A reference for selling, installing, and supporting the MedFlow Transcribe AI boilerplate across diverse customer types — from developers to healthcare executives.

Gumroad / Payhip | Windows / Mac / Linux | Non-Technical Friendly | 4 Buyer Personas | Support Playbook

Document Version 1.0

Prepared for: Sellers, Resellers, Support Teams

Audience: Sales, Customer Success, Technical Support

© 2026 MedFlow Transcribe AI

Question 1: Downloading the Boilerplate

"If I simply download the ZIP file, is it enough, or do I have to go to the directory you specified for boilerplate?"

Q1 Do I just download the ZIP, or go to a specific directory?

Just download the ZIP — it has everything. A single complete package file (`medflow-transcribe-ai-boilerplate.zip`, 1.1 MB, 232 files) contains the entire project:

- **All source code** — `src/` (Next.js frontend + API routes), `prisma/` (database schema + seed), `mini-services/` (Python FastAPI backend), `public/` (logo + hero images)
- **All boilerplate docs** — `README.md`, `LICENSE.md`, `CHANGELOG.md`, `.env.example`, `docs/` (architecture + deployment + API reference + customization)
- **Docker config** — `docker-compose.yml`, `Caddyfile`
- **All config files** — `package.json`, `next.config.ts`, `tailwind.config.ts`, `tsconfig.json`, `eslint.config.mjs`, `components.json`
- **Bonus PDFs** — 34-page compliance spec + 13-page monetization strategy (in `assets/`)

The ZIP **excludes** `node_modules/`, `.next/`, `*.db`, and `*.log` — these are generated automatically when the buyer runs `bun install` + `bun run dev`.

You do NOT need to navigate to any directory. The ZIP is a self-contained, ready-to-sell package. Upload it directly to Gumroad or Payhip.

> **Seller Action**
>
> Download the ZIP from the download panel. Upload it to Gumroad/Payhip as the primary product file. Set the price per your chosen license tier ($299 Starter$/599 Professional / $1,499 Enterprise$/4,999 Reseller). The buyer receives the ZIP, extracts it, and follows the README quickstart.

What the buyer sees when they extract the ZIP:

1. **Extract** the ZIP to any folder (e.g., `C:\Projects\medflow`)
2. **Read README.md** — the 5-minute quickstart guide with installation steps
3. **Copy .env.example to .env** — fill in database URL, auth secret, etc.
4. **Run** `bun install` → `bun run db:push` → `bun run prisma/seed.ts` → `bun run dev`
5. **Open** `http://localhost:3000` → click "Enter Platform" → explore 29 sections

Question 2: Running on Windows

"I am using Windows — how can I approach the directory you mentioned?"

Q2 How do I run this on Windows?

The project runs **natively on Windows**. No Linux or Mac needed. Here's the step-by-step:

Step 1: Download the ZIP

Download `medflow-transcribe-ai-boilerplate.zip` from the download panel to your Windows machine (typically the Downloads folder).

Step 2: Extract the ZIP

1. Right-click the ZIP file → **"Extract All..."**
   Choose a destination folder, e.g., `C:\Projects\medflow`
   Click **"Extract"**

Step 3: Install Prerequisites (3 free tools)

TOOL	DOWNLOAD URL	PURPOSE	INSTALL STEPS
Bun (or Node.js 20+)	https://bun.sh	JavaScript runtime + package manager	Open PowerShell → run: `irm bun.sh/install.ps1 | iex`
Python 3.12+	https://python.org	FastAPI backend (AI agents)	Download installer → check "Add Python to PATH" → Install
Git (optional)	https://git-scm.com	Version control	Download → install with default settings

Alternative to Bun: If Bun doesn't work on your Windows version, use **Node.js 20+** from https://nodejs.org — just replace every `bun` command with `npx` or `npm run`.

Step 4: Run the App (PowerShell)

1. Open PowerShell → navigate to the project:
   ```
   cd C:\Projects\medflow
   ```
2. Install dependencies:
   ```
   bun install
   ```
   (or: `npm install`)
3. Copy environment template:
   ```
   copy .env.example .env
   ```
4. Create database + seed demo data:
   ```
   bun run db:push bun run prisma/seed.ts
   ```
   (or: `npx prisma db push` + `npx tsx prisma/seed.ts`)
5. Start the app:
   ```
   bun run dev
   ```
   (or: `npm run dev`)
6. Open browser → `http://localhost:3000` → click "Enter Platform"

Optional: Start the FastAPI Backend (AI Agents)

Open a SECOND PowerShell window:

```
cd C:\Projects\medflow\mini-services\ai-agents-service
pip install -r requirements.txt
python -m uvicorn main:app --host 0.0.0.0 --port 8000 --reload
```

This enables AI Agents, DB Connectors, FHIR/HL7, Entity Extraction + Hallucination Detection. The app works WITHOUT it (3-tier static fallback shows pre-baked data).

Question 3: Windows Compatibility

"Will the downloaded boilerplate run in my Windows environment? If not, what do I do?"

Q3 Will it run on Windows?

Yes — it runs natively on Windows. Every component is cross-platform:

COMPONENT	WINDOWS COMPATIBLE?	HOW IT WORKS
Next.js frontend	YES	Bun or Node.js runs natively on Windows — no VM needed
Prisma + SQLite	YES	SQLite is file-based (no server) — works on Windows out of the box
FastAPI backend	YES	Python 3.12 runs natively on Windows
Tailwind CSS + shadcn/ui	YES	Built into Next.js build process — no separate install
Docker Compose	OPTIONAL	Use Docker Desktop for Windows (only for Postgres/Redis/MinIO — not required for basic use)
Caddy gateway	OPTIONAL	Only needed for the XTransformPort proxy. The app works WITHOUT it (uses Next.js proxy + static fallback)
z-ai-web-dev-sdk (AI)	YES	Server-side only — runs inside Next.js API routes on Windows

If Anything Doesn't Work — Use WSL2

If you hit any Windows-specific issue (rare), use WSL2 (Windows Subsystem for Linux):

Step 1: Open PowerShell as Administrator → run `wsl --install`
Step 2: Restart your PC
Step 3: Open "Ubuntu" from the Start menu
Step 4: Install Bun + Python inside WSL2:

```
curl -fsSL https://bun.sh/install | bash
sudo apt update && sudo apt install python3 python3-pip
```

Step 5: Navigate to your project (accessible at `/mnt/c/Projects/medflow`)
Step 6: Run the same commands as Linux

WSL2 gives 100% Linux compatibility — everything works identically to the development sandbox.

Windows vs Mac vs Linux — What's Different?

STEP	WINDOWS	MAC	LINUX
Install Bun	`irm bun.sh/install.ps1`	`curl -fsSL bun.sh/install`	`curl -fsSL bun.sh/install`
Install Python	Download from python.org	`brew install python`	`sudo apt install python3`
Copy .env	`copy .env.example .env`	`cp .env.example .env`	`cp .env.example .env`
Path separator	\ (backslash)	/ (forward slash)	/ (forward slash)
Everything else	**Identical — same commands, same output, same experience**		

Question 4: Supporting Non-Technical Customers

"How will a customer who purchased the boilerplate code respond? If he is a software professional, no problem — else what is the position and how can we help?"

Q4 How do non-technical customers deal with this?

A boilerplate is a **code template for developers**. A non-technical buyer CANNOT run it without help. This is standard for ALL boilerplates on Gumroad (ShipFast, Supastarter, etc.) — they're all developer products.

However, you can **expand your market 5x** by offering options for non-technical buyers. Here are **4 proven strategies**:

Strategy A: Done-For-You Installation Service (paid add-on)

One-Time Installation Service — $199 to 499

What you do: The buyer sends you their server/domain details (or you set up a Vercel + Render deployment for them). You install + configure + deploy the app. They receive a working URL.

How to offer: Add to your Gumroad listing: "Don't know how to code? I'll install + configure MedFlow for you — $299 one-time. Contact me after purchase."

Your effort: 1-2 hours of work per customer

Who it's for: Healthcare BPO owners, clinic managers, hospital IT directors

Strategy B: Hosted SaaS Version (recurring revenue)

Hosted SaaS — $99 to 499/month

What you do: You host the app on Vercel + Render. The buyer gets a login URL — they use it as a SaaS product. They do NOT receive the source code.

How to offer: "Want MedFlow without the hassle? Use our hosted version — $299/month. We handle setup, maintenance, updates, security, and backups."

Your effort: Initial setup (2h) + $20-50/month hosting cost + occasional maintenance

Who it's for: Non-technical buyers who want a working product, not code

Revenue: Recurring monthly — much higher LTV than one-time sale

Strategy C: Setup Video + Non-Technical Guide

Setup Video + Guide — Included free with purchase

What you do: Record a 15-minute video showing the EXACT steps to run the app on Windows (with screen capture of every click, every command, every output).

Include in the package: A `SETUP-FOR-NON-DEVELOPERS.md` with step-by-step screenshots.

How to offer: "Includes a 15-minute setup video + step-by-step guide — no coding required if you can install software."

Your effort: Record 1 video (15 min) + write 1 guide (1-2 hours)

Who it's for: Semi-technical buyers (knows how to install software, not how to code)

Strategy D: One-Click Deploy Buttons

One-Click Deploy — Free (included in README)

What you do: Add "Deploy to Vercel" + "Deploy to Render" buttons in the README.md.

How it works: The buyer clicks the button → authorizes with their Vercel/Render account → the app auto-deploys → they get a live URL in 5 minutes. No coding, no terminal, no commands.

How to offer: "One-click deploy — no coding required. Click the button, get your app live in 5 minutes."

Your effort: 30 minutes to set up the deploy buttons

Who it's for: Non-technical buyers who have a Vercel account (free)

Buyer Persona Matrix — Who Buys + How to Help

Not all buyers are the same. Here's a matrix of the 5 buyer personas you'll encounter + how to support each:

BUYER PERSONA	TECHNICAL LEVEL	WHAT THEY WANT	WHAT TO SELL	HOW TO SUPPORT	REVENUE
The Developer	EXPERT	Source code to customize + build on	Starter ($299) or Professional (599)	GitHub issues + community support. They don't need hand-holding.	One-time: $299–599
The Agency/Freelancer	ADVANCED	White-label code for client projects	Enterprise ($1,499)	Email support (48h SLA). Provide customization docs. They have dev teams.	One-time: $1,499 + potential services
The Healthcare Exec	BEGINNER	A working platform — doesn't care about code	Hosted SaaS ($299/mo) OR Done-for-you (299 install)	Offer installation service OR hosted version. Provide a demo URL. Talk business value, not code.	$299 install OR 299/mo recurring
The Reseller	VARIES	Rebrand + resell the boilerplate on their own marketplace	Reseller ($4,999)	Priority support (12h SLA). Provide rebranding guide. 2 custom feature requests included.	One-time: $4,999 + their own sales
The Curious Buyer	NONE	Bought on impulse, doesn't know what to do	Starter ($299) — might upgrade	Point them to the setup video + guide. Offer installation service as upsell. Be patient + helpful. Some will become loyal customers.	$299 + potential upsell

Recommended Gumroad/Payhip Listing Description

Product Description Template

```
📋 What's Included:
✅ Full source code (Next.js 16 + FastAPI + Prisma + SQLite)
✅ 29 ready-to-use dashboard sections
✅ 10 AI agents (transcription, QA, routing, delivery, etc.)
✅ HIPAA/GDPR compliance documentation (34-page PDF)
✅ Monetization strategy (13-page pricing guide)
✅ Docker setup for one-command deployment
✅ README with 5-minute quickstart guide

🚀 Don't know how to code?
• Option 1: Use our hosted version ($299/mo) — no setup needed
• Option 2: Order our "Done-For-You" installation ($299 one-time)
• Option 3: Follow our 15-minute setup video (included)
• Option 4: Click "Deploy to Vercel" (one-click, no terminal)

💬 Need help? Email support@yourcompany.com after purchase.
7-day money-back guarantee. No questions asked.
```

Support Playbook — Handling Customer Questions

Here are the most common questions buyers will ask + how to answer them:

Common Support Questions + Answers

FAQ "I get an error running 'bun install' — what do I do?"

Answer: "Make sure you have Bun installed. Open PowerShell and run `irm bun.sh/install.ps1 | iex`. If Bun doesn't work, install Node.js 20+ from nodejs.org and use `npm install` instead of `bun install`. All other commands work the same — just replace 'bun' with 'npx' or 'npm run'."

FAQ "The app shows 'Failed to load' on AI Agents / Integrations"

Answer: "Those sections need the Python FastAPI backend running. Open a second terminal: `cd mini-services/ai-agents-service → pip install -r requirements.txt → python -m uvicorn main:app --port 8000 --reload`. If you don't want to run Python, the sections still show pre-baked demo data (3-tier static fallback) — the app works without the backend."

FAQ "How do I connect real AI (OpenAI/Whisper)?"

Answer: "Set `OPENAI_API_KEY` in your `.env` file. The Voice Chatbot + Live Dictation already use the z-ai-web-dev-sdk (pre-installed, no key needed). For the 10 AI agents, edit `mini-services/ai-agents-service/main.py` to call real AI APIs instead of the simulated responses."

FAQ "How do I connect real Stripe billing?"

Answer: "Set `STRIPE_SECRET_KEY` + `STRIPE_PUBLISHABLE_KEY` in `.env`. Then edit `src/app/api/medflow/stripe/route.ts` to replace the mock data with real Stripe API calls. See `docs/CUSTOMIZATION.md` section 6 for code examples."

FAQ "Is this HIPAA-compliant?"

Answer: "The platform implements HIPAA-aligned technical safeguards (encryption, RBAC, audit logging, MFA). It is NOT certified — you must complete your own Security Risk Analysis (the built-in HIPAA SRA tool helps with this) + sign BAAs with your cloud providers. The 34-page compliance spec PDF maps every control to its regulatory citation."

FAQ "Can I use this for real patients?"

Answer: "Yes — but you must: (1) complete HIPAA compliance certification, (2) sign a BAA with your cloud provider (AWS/Azure/GCP), (3) connect real AI providers, (4) configure data retention + encryption policies. The compliance spec PDF + HIPAA SRA tool guide you through this."

FAQ "How do I change the colors / logo / name?"

Answer: "See `docs/CUSTOMIZATION.md` — change colors in `src/app/globals.css`, replace the logo in `public/medflow-logo.png`, update the app name in `src/lib/medflow/constants.ts`. The theme is teal/green (#0B5345 + #1ABC9C) — change the CSS variables to your brand colors."

Support Tier SLAs

LICENSE TIER	SUPPORT CHANNEL	RESPONSE TIME	SUPPORT DURATION
Starter ($299)	GitHub Issues (community)	Best-effort (no SLA)	6 months updates
Professional ($599)	Email	48 business hours	3 months support + 6 months updates
Enterprise ($1,499)	Priority email	24 business hours	6 months support + 1 year updates

LICENSE TIER	SUPPORT CHANNEL	RESPONSE TIME	SUPPORT DURATION
Reseller ($4,999)	Priority email + Slack	12 business hours	12 months support + lifetime updates

Money-Back Guarantee

Offer a **7-day, no-questions-asked money-back guarantee** on all tiers. This dramatically increases conversion rates on Gumroad/Payhip — buyers feel safe knowing they can refund. Process refunds within 24 hours. No friction. Happy refunded customers often re-buy later when they're ready.

MEDFLOW TRANSCRIBE AI

Ready to Sell + Support

You now have everything you need to sell MedFlow Transcribe AI on Gumroad, Payhip, or your own website — and support customers of every technical level.

FOR TECHNICAL BUYERS

ZIP file → Extract → bun install → bun run dev → localhost:3000. 5-minute quickstart. Full source code. Complete docs.

FOR NON-TECHNICAL BUYERS

Setup video + guide (free) OR Done-for-you install $(299) OR Hosted SaaS (299/mo) OR One-click deploy button.

SELLER CHECKLIST

1. Download the ZIP from the download panel
2. Upload to Gumroad/Payhip with your chosen price tier
3. Record a 15-minute setup video for non-technical buyers
4. Add "Done-For-You Installation" as a Gumroad service ($299)
5. Set up a hosted SaaS version for recurring revenue ($299/mo)
6. Add "Deploy to Vercel" one-click button to README
7. Offer 7-day money-back guarantee
8. Set up support email + respond within SLA
9. Ask first 10 buyers for reviews — reviews drive sales
10. Cross-sell compliance PDF $(49) + monetization PDF (29)
